MINETEXT - MCEdit filter to write words into the world

posted Mar 8, 2013, 7:23 AM by Adrian Brightmoore [updated Mar 9, 2013, 8:04 AM]

This MCEdit filter converts text you write into blocky words in the Minecraft world.

(2013-03-09 - update v5 includes a fixed width font from /u/katra_ix, the prototype font, and some large Minecraft blocks that you can 'type' into the world as letters a-s)

(2013-03-07 - update v4 includes a proportional font, and support if you want to add your own. Create a directory under your filters/font directory to add your own font)

To install:

1. Copy the .py file into your MCEdit filters directory
2. Move the font folder into your MCEdit filters directory

To use:

1. Add any new 5W 10H 2L .schematics you want to the font directory. The naming convention is .schematic
2. Select a region in MCEdit
3. Enter your text in the Message field
4. Run the filter.

You can change the material with MCEdit's Replace tool.
